

Life and Device S.r.l.

Life and Device is a service provider specialized in studies on implantable prostheses since 2008. The synergy between the long-term experience of our team and the scientific updating brought in by our young researches makes L&D a unique company on the market.

Life and Device is a small/medium concern; although the team is composed of three biologists that developed a large experience in clinical and preclinical studies by a constant collaboration with University Institutes; therefore Life and Device team can be considered one of the most competent in the European Union in its field.

L&D takes its rightful place into market as a specialist in anatomic-morphological, histochemical, immunohistochemical and morphometric analyses; each analysis is carefully adapted according to the requested study and the device pattern. The investigations can also be performed through the use of scanning electron microscope (S.E.M.), transmission electron microscopy (T.E.M.); the quantification of chemical elements in biological tissues can also be performed.

L&D assists manufacturers of biological and synthetic prostheses in compliance and safety controls, both in pre-clinical and clinical phases, performs biocompatibility studies and provides the results by original certified reports that can be directly used at International Control Commissions.
